Level 3 Biology, 2006

90716 Describe animal behaviour and plant responses in relation to environmental factors

Credits: Four 9.30 am Thursday 30 November 2006

Check that the National Student Number (NSN) on your admission slip is the same as the number at the top of this page.

You should answer ALL the questions in this booklet.

If you need more space for any answer, use the page(s) provided at the back of this booklet and clearly number the question.

Check that this booklet has pages 2–14 in the correct order and that none of these pages is blank.

YOU MUST HAND THIS BOOKLET TO THE SUPERVISOR AT THE END OF THE EXAMINATION.

| For Assessor's use only Achievement Criteria | | | | |
|---|---|---|--|--|
| Achievement | Achievement with Merit | Achievement with Excellence | | |
| Describe animal behaviour and plant responses in relation to environmental factors. | Describe animal behaviour and plant responses in relation to environmental factors. | Describe animal behaviour and plant responses in relation to environmental factors. | | |
| | Explain animal behaviour or plant responses in relation to environmental factors. | Discuss animal behaviour or plant responses in relation to environmental factors. | | |
| Overall Level of Performance (all criteria within a column are met) | | | | |

You are advised to spend 40 minutes answering the questions in this booklet.

Assessor's use only

QUESTION ONE: PLANT RESPONSES TO LIGHT

Figure 1 shows the response of recently germinated wheat shoots (coleoptiles) to a directional light source. The coleoptiles have been treated in several different ways.

For copyright reasons, this resource cannot be reproduced here.

Figure 1: Growth of wheat coleoptiles in response to a directional light source.

Campbell, Reece & Mitchell, Biology, 5th edition (Benjamin Cummings, 1999)

| (a) | Name the response shown by the bent coleoptiles AND identity the hormone that regulates plants' growth responses to light. |
|-----|--|
| | Response: |
| | Hormone: |
| (b) | Give a reason, based on evidence from Figure 1, for concluding that this hormone is produced by cells at the tip of the coleoptile. |

QUESTION TWO: ANIMAL BEHAVIOUR - ORIENTATION

Assessor's use only

Much of animal behaviour is innate, or inborn. Such behaviour patterns may be quite simple, or are produced in response to simple stimuli. They include kineses and taxes.

| Evolain why | this behaviour would be an advantage to your named animal in its normal |
|----------------------------|---|
| | this behaviour would be an advantage to your named animal in its normal. |
| Explain why environment | |
| | |
| | |
| | |

Figure 2 shows the results of an experiment carried out to study homing behaviour in a hunting wasp. This wasp digs a burrow and then flies off to capture a caterpillar, which it will leave in the burrow as food for its own young.

Assessor's use only

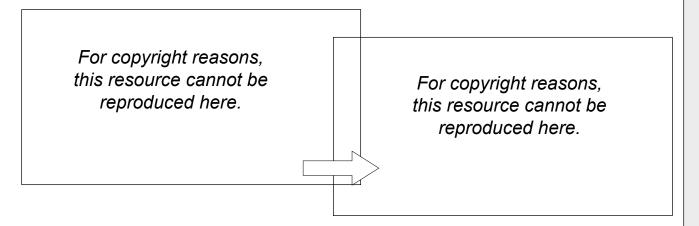

Figure 2:

(1) Pine cones placed round burrow while wasp inside; wasp leaves and returns to nest; (2) Pine cones moved while wasp away on hunting trip.

QUESTION THREE: PLANTS AND BIOLOGICAL CLOCKS

Assessor's use only

Many everyday processes in plants operate rhythmically on a daily, monthly or annual basis. Plants also show longer cycles of behaviour that are influenced by day length. Control of flowering is one example.

| (a) | Give the term used to describe a cycle dependent on the length of the day or night. | | | |
|-------|--|--|--|--|
| | | | | |
| DI. | | | | |
| | s that flower after exposure to short days are described as 'short-day' plants. 'Long-day' plants re longer light exposure before they will flower. | | | |
| poins | poinsettia's bright flowers make it a popular plant over the Christmas period. However, settia is a short-day plant, while in New Zealand, Christmas happens during the longest ght hours of the year. | | | |
| (b) | Describe and explain the lighting conditions that would be required to grow poinsettias in New Zealand and have them flowering exactly at Christmas. | | | |

QUESTION FOUR: SOCIAL BEHAVIOUR

Assessor's use only

Black swans were introduced to New Zealand in the 1800s and have since spread throughout the country. On smaller ponds and lagoons, they occupy territories during the breeding season.

| (a) | Describe TWO advantages of holding a territory. |
|--------|---|
| | |
| | |
| | |
| | |
| As the | ly hatched black swan cygnets have very short necks, and are unable to feed in deeper water. ne adult birds do not actively feed their young, this restricts the areas in which cygnets can feed. swans breed in territories on Pukepuke Lagoon, a 15 ha wetland in the Manawatu. The size of territories varies considerably, from 0.1 ha to 1.5 ha. |
| (b) | Explain why the territories vary so much in size. |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

| | ek swans use a range of aggressive displays to defend their territories, to settle disputes with r swans, or to indicate position in a social hierarchy. | Assessor's use only |
|-----|--|---------------------|
| (c) | Explain why the swans use these displays, rather than fighting over resources. | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

Note that this question continues on the next page.

| Breeding by black swans is seasonal in New Zealand. Sexual activity is spread over much of the year (see Figure 3 below). Cygnets usually appear in August, after an incubation period of 33 days. | Assessor's use only |
|--|---------------------|
| For copyright reasons, this resource cannot be reproduced here. | |
| Figure 3: Copulatory activity in black swans on Pukepuke Lagoon, 1981 breeding season. A. M. Bimler, unpublished PhD thesis | |
| (d) Describe the pattern of sexual activity shown in this graph. | |
| | |
| | |
| | |

| | 13 | | | |
