## 91166 Demonstrate understanding of chemical reactivity Collated questions on equilibria

(2022:1)
(a) Hydrogen iodide, $\mathrm{HI}(\mathrm{g})$, can be produced through the reaction of hydrogen gas, $\mathrm{H}_{2}(\mathrm{~g})$ with iodine gas, $\mathrm{I}_{2}(\mathrm{~g})$, as shown in the equation below.

$$
\mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g}) \quad \Delta_{\mathrm{r}} \mathrm{H}=+53.0 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

(i) Write the $K_{\mathrm{c}}$ expression for this reaction. $K_{\mathrm{c}}=$
(ii) At $490^{\circ} \mathrm{C}$, the equilibrium mixture has a concentration of $0.105 \mathrm{~mol} \mathrm{~L}^{-1}$ for both $\mathrm{H}_{2}(\mathrm{~g})$ and $\mathrm{I}_{2}(\mathrm{~g})$, while the concentration of HI is $0.711 \mathrm{~mol} \mathrm{~L}^{-1}$. Calculate the value of $K_{\mathrm{c}}$ at $490^{\circ} \mathrm{C}$.
(iii) Explain what would happen to the value of $K_{c}$ if the temperature of the equilibrium mixture was increased.
(2022:2)
(a) Methanol, $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{g})$, is manufactured through the reaction of carbon monoxide, $\mathrm{CO}(\mathrm{g})$, with hydrogen gas, $\mathrm{H}_{2}(\mathrm{~g})$. The equation for the equilibrium that is established is shown below.

$$
\mathrm{CO}(\mathrm{~g})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{OH}(\mathrm{~g})
$$

Once chemical equilibrium has been established, the Concentrations of all species present in the reaction are recorded and graphed below.

(i) Explain how the graph shows the system is at equilibrium throughout Section $A$. Refer to the rates of the forward and reverse reactions in your answer.
(ii) At the beginning of Section B, in the graph on the previous page, some carbon monoxide, $\mathrm{CO}(\mathrm{g})$, is added to the reaction vessel. Explain, using equilibrium principles, how the system responds to restore equilibrium. Refer to the graph in your answer.
(iii) Using equilibrium principles, explain why carrying out the reaction at high pressure is advantageous in the manufacture of methanol, $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{g})$.

## (2021:2)

(a) The equilibrium constant expression for a reaction is:

$$
K_{\mathrm{c}}=\frac{\left[\mathrm{NO}_{2}(\mathrm{~g})\right]^{2}}{[\mathrm{NO}(\mathrm{~g})]^{2}\left[\mathrm{O}_{2}(\mathrm{~g})\right]}
$$

Write the chemical equation for this reaction. You can assume all species present in the reaction are represented in the Kc expression.
(b) For the above reaction, the value for $K_{c}$ at $230^{\circ} \mathrm{C}$ is $6.44 \times 10^{5}$ ( 644000 ). At the concentrations below, the reaction is not at equilibrium.

| Gas | NO | $\mathrm{O}_{2}$ | $\mathrm{NO}_{2}$ |
| :---: | :---: | :---: | :---: |
| Concentration $\left(\mathrm{mol} \mathrm{L}^{-1}\right.$ ) | 0.0102 | 0.0128 | 0.989 |

(i) By using the $K_{c}$ expression in part (a) above and the concentrations shown in the table, explain why the reaction is not at equilibrium.
(ii) To reach equilibrium, would the forward or backward reaction need to be favoured? Justify your answer.
(c) The following equation shows a system in equilibrium.

$$
\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\rightleftharpoons) \mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq}) \quad K_{\mathrm{c}}=1.74 \times 10^{-5}
$$

Explain, using equilibrium principles, the effect on the position of the equilibrium when:
(i) a small amount of concentrated ethanoic acid, $\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})$, is added.
(ii) dilute sodium hydroxide solution, $\mathrm{NaOH}(\mathrm{aq})$, is added.
(iii) When the temperature of the equilibrium system is increased, the $K_{\mathrm{c}}$ value also increases. Justify, using equilibrium principles, whether the forward reaction is exothermic or endothermic.
(2020:3)
(a) (i) Write the equilibrium constant expression, $K_{c}$, for the conversion of gaseous carbonyl fluoride, $\mathrm{COF}_{2}(\mathrm{~g})$, to the gas carbon tetrafluoride, $\mathrm{CF}_{4}(\mathrm{~g})$ and carbon dioxide, $\mathrm{CO}_{2}(\mathrm{~g})$.

$$
2 \mathrm{COF}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{CF}_{4}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g})
$$

(ii) At equilibrium, carbonyl fluoride, $\mathrm{COF}_{2}$, has a concentration of $0.040 \mathrm{~mol} \mathrm{~L}^{-1}$. The concentration of both carbon tetrafluoride, $\mathrm{CF}_{4}$, and carbon dioxide, $\mathrm{CO}_{2}$, is $0.80 \mathrm{~mol} \mathrm{~L}^{-1}$. Calculate the $K_{c}$ for this equilibrium.
(iii) At a different temperature, the $K_{c}$ value is 50 . Explain what the value of the $K_{c}$ indicates about the extent of this reaction.
(iv) The enthalpy change, $\Delta_{\mathrm{r}} \mathrm{H}$, for the decomposition of carbonyl fluoride is $-24 \mathrm{~kJ} \mathrm{~mol}^{-1}$.

Explain what happens to the value of $K_{c}$ when the temperature is decreased.
(b) The following equilibrium was established in the laboratory by mixing iron(III) nitrate solution, $\mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}(\mathrm{aq})$, with potassium thiocyanate solution, $\mathrm{KSCN}(\mathrm{aq})$.

$$
\begin{aligned}
& \mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{SCN}^{-}(\mathrm{aq}) \rightleftharpoons[\mathrm{FeSCN}]^{2+}(\mathrm{aq}) \\
& \text { orange colourless dark red }
\end{aligned}
$$

The forward reaction produces heat. Explain, using equilibrium principles, the effect on the colour of the solution if:
(i) More potassium thiocyanate solution, $\operatorname{KSCN}(\mathrm{aq})$, is added to the reaction mixture.
(ii) Solid sodium fluoride is added to the mixture. The added $\mathrm{F}^{-}$ions react with the $\mathrm{Fe}^{3+}$ ions.
(iii) A test tube containing the reaction mixture is placed in a beaker of recently boiled water.

## (2019:2)

The Haber process combines nitrogen, $\mathrm{N}_{2}(\mathrm{~g})$, from the air with hydrogen, $\mathrm{H}_{2}(\mathrm{~g})$, to form ammonia, $\mathrm{NH}_{3}(\mathrm{~g})$, which is then used in the manufacture of fertiliser. The equation for this process is $\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})$
(a) (i) Write the equilibrium constant expression for this reaction. $\mathrm{Kc}=$
(ii) Using equilibrium principles, explain why carrying out the Haber process at high pressure is an advantage to the manufacturer.
(iii) In another part of the process, the ammonia, $\mathrm{NH}_{3}(\mathrm{~g})$, is removed as it is produced. Justify this step using equilibrium principles to explain why this would be an advantage to a manufacturer.
(b) $\quad \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g}) \quad \Delta_{\mathrm{r}} \mathrm{H}=-92 \mathrm{~kJ} \mathrm{~mol}^{-1}$

Explain, using equilibrium principles, whether the value of $K c$ would increase or decrease if the temperature of the reaction is increased.
(c) (i) Nitrogen, $\mathrm{N}_{2}(\mathrm{~g})$, can also be reacted with oxygen, $\mathrm{O}_{2}(\mathrm{~g})$, to give nitrogen dioxide, $\mathrm{NO}_{2}(\mathrm{~g})$, and the following $K_{c}$ expression would apply.

$$
K_{\mathrm{c}}=\frac{\left[\mathrm{NO}_{2}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{O}_{2}\right]^{2}}
$$

The $K_{c}$ for the reaction at $25^{\circ} \mathrm{C}$ is $8.30 \times 10^{-10}$.
Calculate the concentration of nitrogen dioxide, $\mathrm{NO}_{2}$, if the concentration of oxygen, O 2 , is $0.230 \mathrm{~mol} \mathrm{~L}^{-1}$ and the concentration of nitrogen, $\mathrm{N}_{2}$, is $0.110 \mathrm{~mol} \mathrm{~L}^{-1}$. Give your answer to appropriate significant figures.
(ii) Explain the effect on $K_{c}$ if the concentration of nitrogen, $\mathrm{N} 2(\mathrm{~g})$, is increased to $0.200 \mathrm{~mol} \mathrm{~L}_{-1}$ at $25^{\circ} \mathrm{C}$ (no calculations are necessary). $\mathrm{N}_{2}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NO}_{2}(\mathrm{~g})$

## (2018:2)

The Contact Process is used industrially in the manufacture of sulfuric acid. One step in this process is the oxidation of sulfur dioxide, $\mathrm{SO}_{2}(\mathrm{~g})$, to sulfur trioxide, $\mathrm{SO}_{3}(\mathrm{~g})$.

$$
2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{SO}_{3}(\mathrm{~g})
$$

(a) Write the equilibrium constant expression for this reaction. $\mathrm{Kc}=$
(b) (i) Calculate the equilibrium constant ( Kc ) for this reaction at $600^{\circ} \mathrm{C}$ using the following concentrations: $\left[\mathrm{SO}_{2}\right]=0.100 \mathrm{~mol} \mathrm{~L}^{-1}\left[\mathrm{O}_{2}\right]=0.200 \mathrm{~mol} \mathrm{~L}^{-1}\left[\mathrm{SO}_{3}\right]=0.0930 \mathrm{~mol} \mathrm{~L}^{-1}$
(ii) Explain what the size of the Kc value indicates about the extent of the reaction at equilibrium.
(c) Explain, using equilibrium principles, why it is important for an industrial plant to continue to remove the sulfur trioxide gas, $\mathrm{SO}_{3}(\mathrm{~g})$, as it is produced.

$$
2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{SO}_{3}(\mathrm{~g})
$$

(d) Predict, using equilibrium principles, the effect on the concentration of sulfur trioxide gas, $\mathrm{SO}_{3}(\mathrm{~g})$, of carrying out the reaction in a larger reaction vessel.
(e) When the reaction is carried out at $450{ }^{\circ} \mathrm{C}$, the Kc value is higher than the value at $600^{\circ} \mathrm{C}$. Justify whether the oxidation of sulfur dioxide gas, $\mathrm{SO}_{2}(\mathrm{~g})$, to sulfur trioxide $\mathrm{gas}, \mathrm{SO}_{3}(\mathrm{~g})$, is exothermic or endothermic.

## (2017:2)

The addition of a small amount of iron to a mixture of nitrogen and hydrogen gases helps to speed up the production of ammonia gas. The reaction described above is an equilibrium reaction, as represented by the following equation:

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

(b) (i) Write the equilibrium constant expression for this reaction.
(ii) The value of the equilibrium constant, $\mathrm{K}_{\mathrm{c}}$, is 640 at $25^{\circ} \mathrm{C}$. Show, by calculation, using the concentrations of the gases given in the table below, whether or not the reaction is at equilibrium. Explain your answer.

| Gas | $\mathrm{N}_{2}$ | $\mathrm{H}_{2}$ | $\mathrm{NH}_{3}$ |
| :---: | :---: | :---: | :---: |
| Concentration $\left(\mathrm{mol} \mathrm{L}^{-1}\right)$ | 0.0821 | 0.0583 | 0.105 |

Is the mixture at equilibrium? (Circle) Yes No
Calculation and explanation:
(c) As the temperature increases, the value of the equilibrium constant, $\mathrm{K}_{\mathrm{c}}$, decreases from 640 at $25^{\circ} \mathrm{C}$ to 0.440 at $200^{\circ} \mathrm{C}$.

Justify whether the formation of ammonia, $\mathrm{NH}_{3}(\mathrm{~g})$, is an endothermic or exothermic reaction.

```
No Brain Too Small - CHEMISTRY
```

## (2017:3)

(b) Two different cobalt(II) complex ions, $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ and $[\mathrm{CoCl} 4]^{2-,}$ exist together in a solution in equilibrium with chloride ions, $\mathrm{Cl}^{-}(\mathrm{aq})$. The forward reaction is endothermic; $\Delta \mathrm{H}$ is positive. The equation for this equilibrium is shown below.

$$
\begin{aligned}
& {\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}(\mathrm{aq})+4 \mathrm{Cl}^{-}(\mathrm{aq}) \rightleftharpoons} \\
& \quad \text { pink } \\
& {\left[\mathrm{CoCl}_{4}\right]^{2-}(\mathrm{aq})+6 \mathrm{H}^{2} \mathrm{O}(\mathrm{I})} \\
& \text { blue }
\end{aligned}
$$

Explain using equilibrium principles, the effect on the colour of the solution if:
(i) more water is added to the reaction mixture
(ii) a test tube containing the reaction mixture is placed in a beaker of ice-cold water.
(c) Brown nitrogen dioxide gas, $\mathrm{NO}_{2}(\mathrm{~g})$, exists in equilibrium with the colourless gas, dinitrogen tetroxide, $\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g})$.

$$
\begin{aligned}
& 2 \mathrm{NO}_{2}(\mathrm{~g}) \rightleftharpoons \\
& \text { brown } \mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \\
& \text { colourless }
\end{aligned}
$$

Explain using equilibrium principles, the effect of decreasing the volume of the container (therefore increasing the pressure) on the observations of this equilibrium mixture.

## (2016:3)

(a) The equilibrium constant expression for a reaction is:

$$
K_{\mathrm{c}}=\frac{\left[\mathrm{CH}_{3} \mathrm{OH}\right]}{[\mathrm{CO}]\left[\mathrm{H}_{2}\right]^{2}}
$$

Write the equation for this reaction.
(b) The ionisation of water is represented by the equation:

$$
2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})
$$

Give an account of the extent of ionisation of water, given $K_{w}=1 \times 10^{-14}$.
(c) When acid is added to a yellow solution of chromate ions, $\mathrm{CrO}_{4}{ }^{2-}(\mathrm{aq})$, the following equilibrium is established.

$$
\begin{aligned}
& 2 \mathrm{CrO}_{4}^{2-}(\mathrm{aq})+2 \mathrm{H}^{+}(\mathrm{aq}) \rightleftharpoons \underset{\text { orange }}{\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})} \\
& \text { yellow }
\end{aligned}
$$

Analyse this equilibrium using equilibrium principles to explain the effect on the colour of the solution when:
(i) more dilute acid is added:
(ii) dilute base is added:
(d) When hydrogen gas, $\mathrm{H}_{2}(\mathrm{~g})$, and iodine gas, $\mathrm{I}_{2}(\mathrm{~g})$ are mixed, they react to form $\mathrm{HI}(\mathrm{g})$, and an equilibrium is established.

$$
\mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g}) \mathrm{K}_{\mathrm{c}}=64 \text { at } 445^{\circ} \mathrm{C}
$$

(i) Calculate the concentration of HI in an equilibrium mixture at $445^{\circ} \mathrm{C}$ when the concentrations of $\mathrm{H}_{2}(\mathrm{~g})$ and $\mathrm{I}_{2}(\mathrm{~g})$ are both $0.312 \mathrm{~mol} \mathrm{~L}^{-1}$.
(ii) Explain the effect on the position of equilibrium if the overall pressure of the equilibrium system is increased.
(iii) When the temperature of the equilibrium system is increased to $510^{\circ} \mathrm{C}$, the $\mathrm{K}_{\mathrm{c}}$ value decreases to 46. Justify, using equilibrium principles, whether the forward reaction is exothermic or endothermic.
(2015:3)
(a) The equilibrium constant for a reaction involving compounds $A, B, C$, and $D$ is shown as:

$$
K_{\mathrm{c}}=\frac{[\mathrm{C}]^{3}[\mathrm{D}]}{[\mathrm{A}][\mathrm{B}]^{2}}
$$

Write the chemical equation for this reaction.
(b) The reaction between ethanoic acid and ethanol is reversible. Ethyl ethanoate and water are the products formed. In a closed system, a dynamic equilibrium is set up.

$$
\begin{gathered}
\text { ethanoic acid + ethanol } \rightleftharpoons \text { ethyl ethanoate + water } \\
\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{aq}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{gathered}
$$

(ii) Explain, using equilibrium principles, the effect of adding more ethanol to the reaction mixture.
(iii) The reaction is quite slow, so a small amount of concentrated sulfuric acid is added as a catalyst.
Explain, using equilibrium principles, the effect of adding this catalyst to the equilibrium mixture.
(c) The following chemical equation represents a reaction that is part of the Contact Process which produces sulfuric acid.

$$
2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{SO}_{3}(\mathrm{~g}) \Delta \mathrm{H}=-200 \mathrm{~kJ} \mathrm{~mol}^{-1}, \mathrm{~K}_{\mathrm{c}}=4.32 \text { at } 600^{\circ} \mathrm{C}
$$

(i) Write an equilibrium constant expression for this reaction. $\mathrm{K}_{\mathrm{c}}=$
(ii) A reaction mixture has the following concentration of gases at $600^{\circ} \mathrm{C}$ :

$$
\left[\mathrm{SO}_{2}(\mathrm{~g})\right]=0.300 \mathrm{~mol} \mathrm{~L}^{-1} \quad\left[\mathrm{O}_{2}(\mathrm{~g})\right]=0.100 \mathrm{~mol} \mathrm{~L}^{-1} \quad\left[\mathrm{SO}_{3}(\mathrm{~g})\right]=0.250 \mathrm{~mol} \mathrm{~L}^{-1}
$$

Justify why this reaction mixture is not at equilibrium. In your answer you should use the equilibrium expression from part (c)(i) and the data provided above to show that the reaction mixture is not at equilibrium.
(iii) The reaction on the previous page was repeated at $450^{\circ} \mathrm{C}$.

Explain, using equilibrium principles, how the change in temperature will affect:

- the value of Kc
- the position of equilibrium.

## (2014:2)

Hydrogen can be produced industrially by reacting methane with water. An equation for this reaction can be represented by:

$$
\begin{gathered}
\mathrm{CH}_{4}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \rightleftharpoons \mathrm{CO}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \\
\mathrm{K}_{\mathrm{c}}=4.7 \text { at } 1127^{\circ} \mathrm{C}
\end{gathered}
$$

(a) (i) Complete the equilibrium constant expression for this reaction: $\mathrm{K}_{\mathrm{c}}=$
(ii) The concentrations of the four gases in a reaction mixture at $1127^{\circ} \mathrm{C}$ are found to be:

| Gas | $\mathrm{CH}_{4}$ | $\mathrm{H}_{2} \mathrm{O}$ | CO | $\mathrm{H}_{2}$ |
| :---: | :---: | :---: | :---: | :---: |
| Concentration $/ \mathrm{mol} \mathrm{L}^{-1}$ | 0.0300 | 0.0500 | 0.200 | 0.300 |

Use these values to carry out a calculation to determine if the reaction is at equilibrium. Mixture at equilibrium? Yes No (circle correct option)

Calculation:
(b) The reaction shown in the equation below is at equilibrium.

$$
\mathrm{CO}(\mathrm{~g})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{OH}(\mathrm{~g})
$$

Describe the effect of each of the following changes on the equilibrium concentration of methanol (increase, decrease, stay the same). Justify your answers using equilibrium principles.

A copper oxide, CuO , catalyst is added.
Amount of $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{g})$ would: increase OR decrease OR stay the same (circle correct answer)
Reason:
$\mathrm{H}_{2}(\mathrm{~g})$ is removed.
Amount of $\mathrm{CH} 3 \mathrm{OH}(\mathrm{g})$ would: increase OR decrease OR stay the same (circle correct answer)
Reason:
(d) In a reaction, the brown gas nitrogen dioxide, $\mathrm{NO}_{2}(\mathrm{~g})$, exists in equilibrium with the colourless gas dinitrogen tetroxide, $\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g})$. The equation for this reaction is represented by:

$$
\begin{array}{ll}
2 \mathrm{NO}_{2}(\mathrm{~g}) & \rightleftharpoons \\
\text { brown gas } & \mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g}) \\
\text { colourless gas }
\end{array}
$$

The table below shows the observations when changes were made to the system.

| Change | Observations |  |
| :--- | :--- | :--- |
|  | increased (by decreasing the volume of the container) | Colour faded |
|  | decreased (by increasing the volume of the container) | Colour darkened |
| Temperature | container with reaction mixture put into hot water | Colour darkened |
|  | container with reaction mixture put into ice water | Colour faded |

Analyse these experimental observations. In your answer you should:

- link all of the observations to equilibrium principles
- justify whether the formation of dinitrogen tetroxide from nitrogen dioxide is endothermic or exothermic.

## (2013:2)

(a) Ammonia gas, $\mathrm{NH}_{3}(\mathrm{~g})$, is formed from hydrogen gas and nitrogen gas, as shown in the following equation.

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

Complete the equilibrium constant expression for this reaction. $\mathrm{K}_{\mathrm{c}}=$
(b) The $\mathrm{K}_{\mathrm{c}}$ for a different reaction is

$$
K_{\mathrm{c}}=\frac{\left[\mathrm{SO}_{3}(g)\right]^{2}}{\left[\mathrm{SO}_{2}(g)\right]^{2}\left[\mathrm{O}_{2}(g)\right]}
$$

Write the chemical equation that corresponds to this expression in the box below.
(c) The two reactions shown in the following table are both at equilibrium.

| Reaction | Equation | Affected by increased pressure |
| :---: | :--- | :---: |
| One | $\mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{g})$ | no |
| Two | $\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})$ | yes |

Compare and contrast the effect of increasing the pressure on both reactions, with reference to the equilibrium positions.
(d) For Reaction Two in part (c), the values of $\mathrm{K}_{\mathrm{c}}$ at different temperatures are shown below.

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

| Temperature | $227^{\circ} \mathrm{C}$ | $327^{\circ} \mathrm{C}$ | $427^{\circ} \mathrm{C}$ | $527^{\circ} \mathrm{C}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{K}_{\mathrm{c}}$ | 90 | 3 | 0.3 | 0.04 |

Use this information to determine whether the formation of $\mathrm{NH}_{3}(\mathrm{~g})$ is endothermic or exothermic.
Justify your reasoning using equilibrium principles.
(e) For Reaction One in part (c), the $\mathrm{K}_{\mathrm{c}}$ value is 46.8 at $491^{\circ} \mathrm{C}$

$$
\mathrm{H}_{2}(\mathrm{~g})+\mathrm{I}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{HI}(\mathrm{~g})
$$

Calculate the concentration of $\mathrm{HI}(\mathrm{g})$, at equilibrium, at $491^{\circ} \mathrm{C}$, if the concentration of $\mathrm{H}_{2}(\mathrm{~g})$ is $0.0190 \mathrm{~mol} \mathrm{~L}^{-1}$ and the concentration of $\mathrm{I}_{2}(\mathrm{~g})$ is $0.210 \mathrm{~mol} \mathrm{~L}^{-1}$.

## (2012:2)

Phosphorus pentachloride gas, $\mathrm{PCl}_{5}(\mathrm{~g})$, decomposes to form phosphorus trichloride gas, $\mathrm{PCl}_{3}(\mathrm{~g})$, and chlorine gas, $\mathrm{Cl}_{2}(\mathrm{~g})$. The equilibrium can be represented as:

$$
\mathrm{PCl}_{5}(\mathrm{~g}) \rightleftharpoons \mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})
$$

(a) Complete the equilibrium constant expression for this reaction. $\mathrm{K}_{\mathrm{c}}=$
(b) The table below shows the value of the equilibrium constant, $\mathrm{K}_{\mathrm{c}}$ at two different temperatures.

| Temperature $/{ }^{\circ} \mathrm{C}$ | Value of $\mathrm{K}_{\mathrm{c}}$ |
| :---: | :---: |
| 200 | $8.00 \times 10^{-3}$ |
| 350 | 0.612 |

(i) Circle the species that will be in the highest concentration at $200^{\circ} \mathrm{C}$.

$$
\mathrm{PCl}_{5}(\mathrm{~g}) \quad \mathrm{PCl}_{3}(\mathrm{~g})
$$

(ii) Explain your answer.
(iii) Calculate the concentration of $\mathrm{PCl}_{5}$ at equilibrium at $350^{\circ} \mathrm{C}$, if the concentrations of $\mathrm{PCl}_{3}$ and $\mathrm{Cl}_{2}$ are both $0.352 \mathrm{~mol} \mathrm{~L}^{-1}$.
(c) For each of the following changes applied to this system:
(i) State if the amount of chlorine gas, $\mathrm{Cl}_{2}(\mathrm{~g})$, would increase or decrease.
(ii) Justify your answers using equilibrium principles.
$\mathrm{PCl}_{3}(\mathrm{~g})$ is removed.
Amount of $\mathrm{Cl}_{2}(\mathrm{~g})$
Reason:
The pressure is decreased.
Amount of $\mathrm{Cl}_{2}(\mathrm{~g})$
Reason:
(d) When the temperature of the equilibrium system is increased from $200^{\circ} \mathrm{C}$ to $350^{\circ} \mathrm{C}$ (at constant pressure), the value of $\mathrm{K}_{\mathrm{c}}$ increases, as shown in the table above. Use this information to determine whether the decomposition of $\mathrm{PCl}_{5}$ is endothermic or exothermic.
Justify your reasoning using equilibrium principles.

## Answers

(2020:3)
(a) (i)

$$
K_{\mathrm{c}}=\frac{\left[\mathrm{CF}_{4}\right]\left[\mathrm{CO}_{2}\right]}{\left[\mathrm{COF}_{2}\right]^{2}}
$$

$$
\begin{equation*}
K_{\mathrm{c}}=\frac{0.8 \times 0.8}{0.40^{2}}=400 \tag{ii}
\end{equation*}
$$

(iii) The value of $K$ is significantly over 1 , so there are far more products than reactants, which means the equilibrium favours the products.
(iv) The reaction is exothermic. If the temperature is decreased, the reaction moves in the exothermic direction to produce more heat energy. For this reaction, it will favour the forward reaction. This leads to fewer reactants / increased products so the value of $K c$ will increase.
(b) (i) Adding thiocyanate ions to the equilibrium means there is an increase in the concentration of a reactant. The system will react to reduce this change so the forward reaction will be favoured to use up the added SCN- ions producing more red [FeSCN] ${ }^{2+}$. This means the dark red colour will intensify.
(ii) The added fluoride ions reacts with the $\mathrm{Fe}^{3+}$ ions, and this decreases the concentration of the $\mathrm{Fe}^{3+}$ in this equilibrium. The system will react by favouring the backward reaction to replace the lost orange $\mathrm{Fe}^{3+}$ ions, while using up red $[\mathrm{FeSCN}]^{2+}$. This means the dark red colour will lighten and it will become more orange.
(iii) The forward reaction produces heat so when the mixture is put into hot water, the reaction moves in the endothermic direction to absorb the added heat energy. This will favour the backward reaction using up red $[\mathrm{FeSCN}]^{2+}$ and producing orange $\mathrm{Fe}^{3+}$, which means the dark red colour will lighten and the mixture will be more orange.
(2019:2)
(a) (i)
$K_{\mathrm{c}}=\frac{\left[\mathrm{NH}_{3}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}}$
(ii) There are four moles of gas particles on the reactant side of the equation, and two moles of gas particles on the product side of the equation. Therefore, when there is an increase in pressure, the system would shift towards the products (to minimise the stress on the equilibrium) since there are fewer gas molecules on the product side. This would increase the yield of ammonia, so would be an advantage for the manufacturer.
(iii) As ammonia gas is removed, the concentration of the products decreases. The system will oppose the change by shifting in the forward direction to form more ammonia/replace ammonia. In industry, this is an advantage as it maximises the amount of ammonia produced.
(b) As the temperature increases, the system will act to reduce the temperature by favouring the endothermic direction to absorb some of the extra heat energy. Since the reaction has a negative $\Delta_{r} H$, this means that the forward reaction is exothermic and produces heat energy. So, an increase in temperature will cause the equilibrium to shift towards the reactants and therefore the concentration of reactants will increase. A higher concentration of reactants (compared to products) will cause the $K_{\mathrm{c}}$ value to decrease.
(c) (i)

$$
\begin{aligned}
{\left[\mathrm{NO}_{2}\right] } & =\sqrt{K_{\mathrm{c}}\left[\mathrm{~N}_{2}\right]\left[\mathrm{O}_{2}\right]^{2}} \\
& =\sqrt{\left(8.3 \times 10^{-10}\right) \times 0.110 \times 0.230^{2}} \\
& =\sqrt{4.830 \times 10^{-12}} \\
& =2.20 \times 10^{-6} \mathrm{~mol} \mathrm{~L}^{-1} 3 \mathrm{sf}
\end{aligned}
$$

(ii) When $\mathrm{N}_{2}(g)$ is added, the system will oppose the change (increase in concentration of $\mathrm{N}_{2}(g)$ ) and therefore the position of the equilibrium will shift in the forward direction to use up some of the added $\mathrm{N}_{2}(g)$. This means more $\mathrm{NO}_{2}(g)$ will be produced. However, the ratio of the concentrations of the reactants and products will remain the same, consequently the value of $K_{c}$ remains unchanged. Only a change in temperature will affect the value of $K_{\mathrm{c}}$.
(2018:2)
(a)

(b) (i)

$$
K_{\mathrm{c}}=\frac{0.093^{2}}{0.1^{2} \times 0.2}=4.32
$$

(ii) The Kc value is larger than 1 so there are more products than reactants at equilibrium.
(c) If the sulfur trioxide is removed as it is produced, $\left[\mathrm{SO}_{3}\right]$ will decrease, so the equilibrium will move to minimise the change (stress placed on the system). This means the reaction will move forward to replace the lost sulfur trioxide. This will increase the yield of the desired product.
(d) Increasing the size of the reaction vessel decreases the pressure of the system. In order to minimise this change / stress, the reaction moves to increase the number of gaseous particles. For this reaction, the greatest number of gaseous particles is the reactants side so the reaction will move backwards towards the reactants. This has the effect of decreasing the amount of sulfur trioxide.
(e) When the temperature decreases to $450^{\circ} \mathrm{C}$, the reaction moves in the exothermic direction to produce more heat. Since the Kc value increased, more products and less reactants are present. This means the reaction produces more products when the temperature drops. This means the oxidation of sulfur dioxide to sulfur trioxide is an exothermic reaction.
(2017:2)
(b) (i)

$$
K_{\mathrm{c}}=\frac{\left[\mathrm{NH}_{3}(a q)\right]^{2}}{\left[\mathrm{~N}_{2}(a q)\right]\left[\mathrm{H}_{2}(a q)\right]^{3}}
$$

$$
\begin{aligned}
K_{\mathrm{c}} & =\frac{0.105^{2}}{0.0821 \times 0.0583^{3}} \\
& =677
\end{aligned}
$$

No, the reaction is not at equilibrium because $677>640$ (values must be equal for a reaction to be at equilibrium). Accept answers between 676-678.
(c) When temperature increases, the reaction moves in the endothermic direction to absorb the added heat. In this reaction, the value of $K$ decreased, indicating the ratio of products to reactants decreased. Since there will be fewer products and more reactants, the equilibrium is favouring the reactants, so adding heat favours the reverse reaction / the position of equilibrium shifts left. Hence, the formation of ammonia gas / forward reaction, is exothermic.
(Temperature is the only factor that can change the $K$ value in an equilibrium).

## (2017:3)

(b) (i) Adding water to this equilibrium means there has been an increase in (concentration of) a product. The system will react to reduce this change, so the backward reaction will be favoured to use up (idea required for Excellence) some of the extra product. This results in an increased concentration of the pink $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ ion, so the solution will turn pink or the pink colour will intensify.
(ii) The ice-cold water will cause the reaction to move in the exothermic direction to compensate for the loss of heat energy / release heat energy (for Excellence) into surroundings. Because this reaction is endothermic (positive $\Delta \mathrm{H}$ value), the exothermic direction will be backwards, so the colour of the solution will become pink or the pink colour will intensify.
(c) The increase in pressure favours the side with the fewest moles of gas on it, so the reaction will move in the forward direction because there is only one mole of $\mathrm{N}_{2} \mathrm{O}_{4}$ gas compared to 2 moles of $\mathrm{NO}_{2}$ gas. This will cause the colour to fade from a darker to a lighter brown. (It won't go colourless because both gases are still present in the mixture.)
(2016:3)
(a) $\mathrm{CO}+2 \mathrm{H}_{2} \rightleftharpoons \mathrm{CH} 3 \mathrm{OH}$
(b) The value of $K_{w}$ at $1 \times 10^{-14}$ is very small, which means that very little water has ionised / dissociated because there is very little product (i.e. very few ions).
(c) (i) Adding dilute acid increases the concentration of the acid, so the reaction moves in the forward direction / favours the products to use up the added acid, so the colour of the solution will become more orange.
(v) Adding base means that acid that reacts with the base is removed from the equilibrium / concentration of the acid decreases. This will drive the equilibrium in the backwards direction / favours the reactants to replace the $\mathrm{H}^{+}$used up, causing the solution to become more yellow in colour. May include the equation $\mathrm{H}^{+}+\mathrm{OH}^{-} \rightleftharpoons \mathrm{H}_{2} \mathrm{O}$ in their answer.
(d) (i) $64=\frac{[\mathrm{HI}]^{2}}{0.312 \times 0.312} \quad[\mathrm{HI}]=\sqrt{64 \times 0.312^{2}}=2.50 \mathrm{~mol} \mathrm{~L}^{-1}$
(ii) There would be no effect on the equilibrium if pressure was increased because there are equal numbers of moles of gas on either side of the equilibrium / in the reactants and products.
(iii) (Temperature is the only factor that can change the $K$ value of an equilibrium). When the temperature increases, the reaction moves in the endothermic direction to absorb the added heat. In this reaction, the value of $K$ decreased, indicating the ratio of products to reactants (numerator to denominator) decreased. Since there will be fewer products and more reactants, adding heat is favouring the backwards reaction. Therefore, the forward reaction is exothermic.

## (2015:3)

(a) $\mathrm{A}+2 \mathrm{~B} \rightleftharpoons 3 \mathrm{C}+\mathrm{D}$
(b) (i) Adding more ethanol causes the equilibrium to move in the forward direction in order to use the extra added ethanol. This is because the equilibrium has to re-establish itself with the added reactant in order to maintain $\mathrm{K}_{\mathrm{c}}$.
(ii) A catalyst speeds up the rate of the reaction so both forward and backward reaction will speed up but no particular reaction is favoured.

$$
K_{\mathrm{c}}=\frac{\left[\mathrm{SO}_{3}\right]^{2}}{\left[\mathrm{SO}_{2}\right]^{2}\left[\mathrm{O}_{2}\right]}
$$

(c) (i)

$$
Q=\frac{0.250^{2}}{0.300^{2} \times 0.100}=6.94
$$

(ii)

Since $K_{c}=4.32, Q \neq K_{c}$, so this reaction mixture is not at equilibrium. This number is greater than the $K_{c}$ value, 4.32, which indicates that the reaction lies to the products side as the larger the $K_{c}$ or $Q$ value, the greater the numerator (products).
(iii) At $450^{\circ} \mathrm{C}$, the temperature has decreased. This reaction is exothermic, as shown by the negative enthalpy. This means that if the temperature is decreased, the reaction will move in the direction that produces more heat. Because this is an exothermic reaction, the exothermic direction is forwards. This will lead to more products and an increase in $\mathrm{K}_{\mathrm{c}}$.
(2014:2)
(a) (i)
$K_{\mathrm{c}}=\frac{\left[\mathrm{H}_{2}\right]^{3}[\mathrm{CO}]}{\left[\mathrm{CH}_{4}\right]\left[\mathrm{H}_{2} \mathrm{O}\right]}$
(iii) No $\mathrm{K}_{\mathrm{c}}=3.6$ which is $<4.7$; therefore the reaction is not at equilibrium since if the reaction was at equilibrium, the $\mathrm{K}_{c}$ would be 4.7 at $1127^{\circ} \mathrm{C}$.
(b) CuO catalyst: Amount of methanol stays the same. A catalyst, such as CuO, will speed up the rate of both the forward and the reverse reactions. The proportions of all of the reactants and products remain the same.
$\mathrm{H}_{2}$ removed: Amount of methanol will decrease. As hydrogen gas is removed, the system will oppose the change and the position of the equilibrium will shift in the reverse direction as more hydrogen is formed. This means the amount of methanol will decrease.
(c) Increasing pressure resulted in the colour fading. This was due to the position of the equilibrium shifting in the forward direction to counteract this change. The system shifts in the direction of the least number of moles of gas since this will decrease the pressure. This forms more $\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g})$, which is colourless, so the colour fades. When the pressure is decreased again the system adjusts to increase the pressure, hence shifts in the direction of a greater number of moles, i.e. in the reverse direction, forming more $\mathrm{NO}_{2}$, resulting in a darker colour due to the brown colour of this gas. When the reaction container is placed in hot water, the system will adjust so that some of the heat is used up; therefore it will shift in the endothermic direction. In this case, the colour darkened, indicating that this favoured the reverse reaction which must be the endothermic direction. When the container was cooled, the colour faded indicating that the forward reaction, forming colourless $\mathrm{N}_{2} \mathrm{O}_{4}$, must be exothermic.
(2013:2)
(a)
$K_{\mathrm{c}}=\frac{\left\lfloor\mathrm{NH}_{3}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}}$
(b) $2 \mathrm{SO}_{2}+\mathrm{O}_{2} \rightleftharpoons 2 \mathrm{SO}_{3}$
(c) When a change is made to a system that is at equilibrium, the system responds to reduce the effect of that change. If there is an increase in pressure, the system responds by decreasing the pressure. This occurs by favouring the reaction that produces fewer gas particles. Because there are now fewer particles hitting the sides of the container, there is less pressure.
In Reaction One there are two moles of gas particles on each side of the equation. Because there are the same numbers of gas particles on both sides of the reaction, then a change in pressure will have no effect as neither reaction will be favoured.
In Reaction Two however, there are four moles of gas particles on the reactant side of the equation and two moles of gas particles on the product side of the equation. Therefore, when there is an increase in pressure, the system would shift and favour the forward reaction meaning there are now fewer gas particles overall and hence fewer gas particles hitting the sides of the container and therefore less pressure overall.
(d) As the temperature increases, $\mathrm{K}_{\mathrm{c}}$ decreases. The decreasing value of $\mathrm{K}_{\mathrm{c}}$ indicates that the reaction is reactant-favoured (i.e. more reactants than products). When temperature increases, the system responds and decreases the temperature by shifting in the endothermic direction. Since the increasing temperature favours the reactants, this must mean that the reverse reaction is endothermic and the forward reaction (formation of $\mathrm{NH}_{3}$ ) is exothermic.
$\frac{[\mathrm{HI}(g)]^{2}}{\left[\mathrm{H}_{2}(g)\right]\left[\mathrm{I}_{2}(g)\right]}=46.8$
$\frac{[\mathrm{HI}(\mathrm{g})]^{2}}{[0.0190][0.210]}=46.8$
$\frac{[\mathrm{HI}(\mathrm{g})]^{2}}{3.99 \times 10^{-3}}=46.8$
$[\mathrm{HI}(g)]^{2}=0.187$
$[\mathrm{HI}(g)]=0.432 \mathrm{~mol} \mathrm{~L}^{-1}$
(2012:2)
(a)
$K_{\mathrm{c}}=\frac{\left[\mathrm{PCl}_{3}\right]\left[\mathrm{Cl}_{2}\right]}{\left[\mathrm{PCl}_{5}\right]}$
(b) (i) $\mathrm{PCl}_{5}$
(ii) The value of Kc is less than 1 /small. This means that the concentration of reactant $\left(\mathrm{PCl}_{5}\right)$ is greater than the concentration of products ( $\mathrm{PCl}_{3}$ and $\mathrm{Cl}_{2}$ ).
(iii)

$$
\begin{aligned}
& K_{\mathrm{c}}=\frac{\left[\mathrm{PCl}_{3}\right]\left[\mathrm{Cl}_{2}\right]}{\left[\mathrm{PCl}_{5}\right]} \\
& {\left[\begin{array}{rl}
{\left[\mathrm{PCl}_{5}\right]=} & \frac{\left[\mathrm{PCl}_{3}\right]\left[\mathrm{Cl}_{2}\right]}{K_{\mathrm{c}}} \\
{\left[\mathrm{PCl}_{5}\right]} & =\frac{0.352 \times 0.352}{0.612} \\
& =0.202 \mathrm{~mol} \mathrm{~L}
\end{array}\right.}
\end{aligned}
$$

(c) When $\mathrm{PCl}_{3}(\mathrm{~g})$ is removed: Amount of $\mathrm{Cl}_{2}$ increases. $\mathrm{As}_{\mathrm{PCl}}^{3}(\mathrm{~g})$ is removed / concentration decreased, the equilibrium will shift to oppose the change, i.e. increase the concentration of $\mathrm{PCl}_{3}(\mathrm{~g})$. This will favour the forward reaction, producing more $\mathrm{Cl}_{2}$.

When the pressure is decreased: Amount of $\mathrm{Cl}_{2}$ increases. Decrease in pressure causes the equilibrium to shift to increase the number of gaseous particles, i.e. shifts equilibrium to the side with the greatest number of moles. Since there are two moles of gaseous products and one mole of gaseous reactant, equilibrium will shift to right. This will favour the forward reaction, producing more $\mathrm{Cl}_{2}$.
(d) At increased temperature the value of Kc increases. This means that equilibrium shifts in favour of products i.e. the forward direction. An increase in temperature causes the equilibrium to shift to favour the reaction that absorbs heat / energy, i.e. the endothermic direction. Hence, the forward reaction is endothermic.
