

Assessment schedule – 2023**Chemistry: Demonstrate understanding of aspects of carbon chemistry (90932)****Evidence Statement**

| Q | Evidence | Achievement | Merit | Excellence |
|------------|---|---|---|---|
| ONE (a) | $ \begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H}-\text{C}-\text{C}-\text{O}-\text{H} \\ \quad \\ \text{H} \quad \text{H} \end{array} \quad \begin{array}{c} \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \\ \quad \quad \quad \quad \quad \quad \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{C}-\text{C}-\text{C}-\text{C}-\text{H} \\ \quad \quad \quad \quad \quad \quad \\ \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \end{array} $ <p style="text-align: center;">ethanol heptane</p> | <ul style="list-style-type: none"> Two correct structures drawn. | | |
| (b) | <p>Ethanol undergoes complete combustion in plentiful oxygen with a blue / invisible / hot flame. Gaseous carbon dioxide and water vapour is produced, as shown in the equation below. In the experiment, the ice-bath is used to condense the colourless H₂O vapour, which is observed as a colourless liquid at point B. Observation linked to purpose. The limewater at C is used to indicate the presence of carbon dioxide. The colourless carbon dioxide is observed as bubbles of gas that turn limewater milky / white. No black deposit is observed on the funnel, as carbon (soot) is not produced in complete combustion / only produced in incomplete combustion. (do not need this).</p> $\text{C}_2\text{H}_5\text{OH}(\ell) + 3\text{O}_2(\text{g}) \rightarrow 2\text{CO}_2(\text{g}) + 3\text{H}_2\text{O}(\ell) \text{ (states not needed)}$ | <ul style="list-style-type: none"> Identifies conditions needed for complete combustion, and resulting flame colour. Links observation to CO₂ OR H₂O Correct products / word equation. | <ul style="list-style-type: none"> Links experiment observations to combustion products at two points . OR Links observations to tests for CO₂ and H₂O. Unbalanced equation, correct reactants. | <ul style="list-style-type: none"> Fully analyses combustion experiment, linking observations to the purpose of the experimental setup. AND Balanced symbol equation. |
| (c) | <p>Complete combustion of heptane produces carbon dioxide gas and water vapour, both of which are greenhouse gases, so they contribute to the greenhouse effect / global warming, which leads to sea-level rise / adverse weather events which endanger human populations / life. The ocean absorbs CO₂ released, and this affects seawater chemistry. This can impact on marine food webs at all levels, including a food supply for humans.</p> <p>Heptane undergoes incomplete combustion producing carbon dioxide and water vapour. It can also produce carbon particles, which can cause asthma and other respiratory problems in people. It also produces carbon monoxide, which is toxic to humans, and can, in extreme situations, result in death since it replaces oxygen in the blood supply.</p> | <ul style="list-style-type: none"> States a valid effect of a combustion product on human health. | <ul style="list-style-type: none"> Links the combustion reaction to an impact on human health for complete combustion. OR For incomplete combustion. | <ul style="list-style-type: none"> Links the combustion products to an impact on human health for BOTH complete and incomplete combustion. |

|--------------|--|--|---|--|
| THREE (a) | <p>Fermentation of glucose will produce ethanol. Enzymes in yeast turn the glucose into ethanol and carbon dioxide. The enzymes in the yeast are required to act as a catalyst for the reaction, which occurs in warm, anaerobic conditions.</p> $\text{C}_6\text{H}_{12}\text{O}_6 \xrightarrow{\text{enzymes}} 2\text{CH}_3\text{CH}_2\text{OH} + 2\text{CO}_2$ <p style="text-align: center;">glucose ethanol</p> | <ul style="list-style-type: none"> Identifies glucose as the reactant. <p>OR</p> <p>Word equation.</p> <ul style="list-style-type: none"> 2 / 3 conditions. | <ul style="list-style-type: none"> Explanation of fermentation linked to conditions. <p>AND</p> <p>Unbalanced symbol equation.</p> | <ul style="list-style-type: none"> Explanation of fermentation linked to conditions. <p>AND</p> <p>Balanced symbol equation.</p> |
| (b) | <p>Methanol and ethanol are both alcohols, whereas ethane is an alkane. Methanol and ethanol are both soluble in water, as they are both alcohols and contain OH groups. The OH groups of the alcohols are attracted to water molecules. The alcohols are more attracted to the water molecules (e.g. methanol – water) than to each other (e.g. methanol – methanol), so they dissolve. Ethane is insoluble in water, as it contains only C and H atoms, and there is not sufficient attractions between the water molecules and ethane molecules.</p> <p>The alcohols methanol and ethanol have higher boiling points than ethane, as the presence of the OH group increases the attractive forces between molecules, requiring a greater amount of heat energy to break. The boiling point of ethanol is higher than methanol, as there is one more carbon atom in ethanol than in methanol, so ethanol has a higher molar mass. As the molar mass increases, the forces of attraction (intermolecular force) between the molecules increase, so more heat energy is required to overcome these forces to form gaseous ethanol.</p> | <ul style="list-style-type: none"> States that both methanol and ethanol are attracted to water. <p>OR</p> <p>States that ethane is not attracted to water.</p> <ul style="list-style-type: none"> Recognises boiling point increases with size / molar mass / number of C atoms. Recognises increased molar mass increases attractive forces | <ul style="list-style-type: none"> Explains solubility of EITHER ethane OR an alcohol linking to the attractions between the molecules and water. Explains that more heat energy is required to separate the higher massed molecules Explains increased molar mass increases attractive forces between molecules/ intermolecular | <ul style="list-style-type: none"> Fully compares the solubility of all three compounds linking to the attractions with water. Fully compares the boiling point of all three compounds. Must link to heat energy, molar mass and relative strength of forces between the molecules |
